Acknowledgment, license and downloads

- ▶ My presentation was created using Emacs' org-mode and Babel: active code in Org-mode. Babel is developed and maintained by Eric Schulte and Dan Davison who were extremely helpful in answering my questions or fixing bugs.
- Licensed under a Creative Commons Attribution-NonCommercial-ShareAlike 3.0 Germany license.
- ➤ Slides, dataset and R code can be downloaded from my github page:

 https://github.com/berndweiss/ps2012-intro_R (see
 "Downloads" button on the right-hand side).

Objectives

- ▶ Introduce *some* basic concepts of R
- ► Show some common steps in data preparation and data analysis (esp. meta-analysis)
- ▶ Present some showcases which cover advanced usage of R

What is R?

"R is a language and environment for statistical computing and graphics. [...] Many users think of R as a statistics system. We prefer to think of it of an environment within which statistical techniques are implemented. R can be extended (easily) via packages. There are about eight packages supplied with the R distribution and many more are available through the CRAN family of Internet sites covering a very wide range of modern statistics" (http://www.r-project.org/about.html).

Why use R?

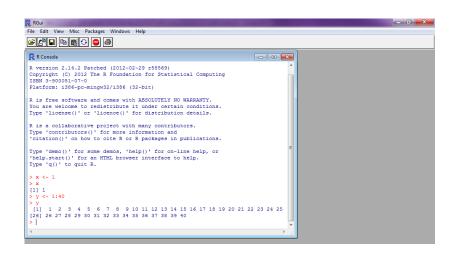

- ▶ It is free (GNU General Public Licence).
- Can be used on many platforms (MS Windows, Linux, Mac OS etc.).
- Includes cutting-edge statistical technologies and state-of-the-art graphics capabilities.
- ► Since R is a fully developed programming language, it is very (extremely) flexible.
- **.** . . .

Why not use R?

- Steep learning curve.
- R is a programming language.
- Sometimes R lacks consistency (packages).

R under MS Windows

Subsection overview

Introduction

Preamble

Five basic R concepts

Installation, help and maintenance

Loading a (SPSS) dataset

Data cleaning and data preparation

Descriptive statistics

Reproducible research (RR) and workflow

Useful books and websites

Five basic R concepts you need to know

- 1. Objects
- 2. Packages
- 3. Grammar (Syntax) of R functions
- 4. Important data types/data structures
- 5. Missing values

It's all about objects

- ► (Nearly) Everything in R is an object (some similarities to Stata's container concept)
- ▶ What are objects? "The entities that R creates and manipulates are known as objects" (AltR: 5), e.g.:
 - Data sets
 - Variables
 - Results of any statistical calculation
- It is possible to access/manipulate pieces of more complex objects (e.g. datasets or regression results)

A first example of an R object

- "<-" means "assign"</p>
- ▶ If you type in the object's name, R prints out its value¹
- "[...]" denotes R output (here, 1, only one element is shown)
- "#" is used for comments

¹Works in most but not all cases.

[1] 100

A second example of an R object

We also can create vectors (1×4) or matrices (2×3) :

```
1 x.vector <- c(1,2,3,4) ## c() means "concatenate"</pre>
2 x.vector
[1] 1 2 3 4
x.matrix <- matrix(c(1,2,3,4,5,6), ncol = 3)
2 x.matrix
     [,1] [,2] [,3]
[1,] 1 3 5
[2,] 2 4 6
```

A third example of an R object

Conduct a t-test and save results in object oTtest.

[1] 0.8752897

```
oTtest <- t.test(rnorm(100) ~ sample(0:1, 100, replace = TRUE))
oTtest
        Welch Two Sample t-test
data: rnorm(100) by sample(0:1, 100, replace = TRUE)
t = 0.1574, df = 80.38, p-value = 0.8753
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
-0.3430843 0.4020391
sample estimates:
mean in group 0 mean in group 1
     0.0420508 0.0125734
Get the test statistic...
· oTtest$statistic
 0.157444
... or the p-value.
oTtest$p.value
```

Packages

- R functions are stored in packages.
- When you download R, it only comes with a very limited set of functions (e.g., it knows nothing about SPSS data files or meta-analysis).
- To load a particular package, use a command like library(meta).
- However, before you can load a package, you have to install (download) it. This can be done via install.packages("meta").
- Whenever a new R session is started, the packages have to be loaded via library(...).

The basic syntax of an R function

- ► The general syntax is: functionname(arglist)
- arglist: A comma separated list of arguments which can be represented by symbol = expression
- ▶ Often, a symbol called x is used; x represents an R object
- Some simple examples:
 - Average of an object a (a vector): mean(x = a)
 - Standard deviation of a: sd(x = a)
 - Correlation between two vectors a and b: cor(x = a, y = b)
- ► Type ?functionname and see "Usage" and "Arguments" for more information.

Important data types/data structures

- ▶ When you are used to SPSS or Stata, you never (rarely) had to deal with data types or structures.
- ► The next few slides introduce some important data types or data structures. For R novices in the social sciences, the most important data structure you encounter is called "data frame". A data frame can be used to store a typical rectangular social sciences data set with varying data modes (numeric, character)
- ► Typically, a data set is provided as text, csv, SPSS, Stata, SAS etc. file. When this file is loaded into R, (in most cases) it is available as data frame.

Important data types/data structures (cont'd)

Scalar

```
x scalar <- 1
2 x.scalar
         [1] 1
 Vector
x.vector < -c(1,2,3)
 x.vector
         [1] 1 2 3
 ► Factor (nominal scale; sth like mean(x.factor) does not work!)
x.factor <- factor(c(1,2,3), labels = c("low", "middle", "high"))</pre>
2 x.factor
         [1] low middle high
```

Levels: low middle high

Important data types/data structures (cont'd)

▶ Data frame (each column can have a different data type)

```
1 \times df \leftarrow data.frame(ID = c(1,2,3), sex = factor(c("f", "f", "m")),
                      age = c(22, 45, 12))
3 x.df
    ID sex age
 1 1 f 22
 2 2 f 45
 3 3 m 12

    List (most complex data structure)

 x.list < - list(a = c(1,2,3), b = x.df)
2 x.list
        $a
    [1] 1 2 3
    $b
      ID sex age
    2
      2 f 45
       3
           m 12
```

Missing data

- ► The symbol NA (Not Available) represents missing values.
- ▶ Unlike SPSS, most R functions do not use a listwise deletion strategy, e.g.:

```
x.na <- c(1,2,3, NA, 5)
mean(x.na)
```

[1] NA

However, if you specify na.rm = TRUE then mean() will calculate the mean:

```
mean(x.na, na.rm = TRUE)
```

[1] 2.75

Section overview

Introduction
Preamble
Five basic R concepts

Installation, help and maintenance

Loading a (SPSS) dataset

Data cleaning and data preparation

Descriptive statistics

Mean, median & Co

Reproducible research (RR) and workflow Some basics ATEXin 5 minutes

Useful books and websites

Download and installation

- ▶ R can be downloaded from the Comprehensive R Archive Network (CRAN). The process is as follows:
 - 1. Choose a CRAN mirror (e.g., University of Tennessee, Knoxville, TN: http://mira.sunsite.utk.edu/CRAN/).
 - 2. Choose a precompiled binary distribution (e.g., Windows).
 - 3. Choose binaries for base distribution and then "Download R 2.12.0 for Windows".
- ▶ After downloading R-2.12.0-win.exe, execute the file.

Getting help

- help(functionname) (or ?functionname) opens the help pages (in rare cases you have to use quotation marks, e.g. help("[")).
- help.search("keyword") searches all installed packages for "keyword" (e.g., help.search("meta-analysis")).
- The package sos offers the function findFn() which is much more flexible than help.search(), (e.g., findFn("meta-analysis")).
- CRAN Task Views give an overview with respect to a certain topic (e.g.,

"CRAN Task View: Statistics for the Social Sciences") or "CRAN Task View: Psychometric Models and Methods").

Keeping R up-to-date

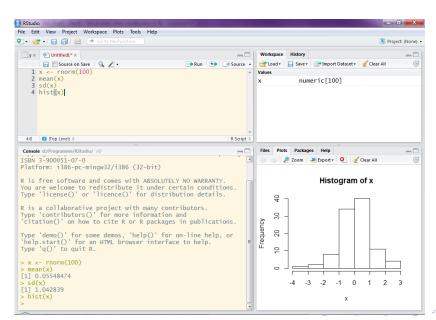

- ▶ Use the latest R version (updated twice a year).
- ▶ Updating packages is easy via update.packages().

Text editors (or: How to interact with R)

Use a text editor which (at least) offers syntax highlighting.

- ► A recommended solution is RStudio (see next slide; can be downloaded from XXX)
- ▶ My preferred solution is Emacs + ESS.
- ► See also The R GUI Projects website.

RStudio

Section overview

Introduction
Preamble
Five basic R concepts

Installation, help and maintenance

Loading a (SPSS) dataset

Data cleaning and data preparation

Descriptive statistics

Mean, median & Co

Reproducible research (RR) and workflow Some basics ATFXin 5 minutes

Useful hooks and websites

Overview

- ► R can handle many different data formats, e.g. SPSS, Stata, SAS, all sorts of text formats or DBMS.
- ► However, many data formats require you to load a certain package which then provides a function to load the data.
- ► Whenever you load a specific dataset, you need to assign it to an object via <-.
- ► The functions fix() and edit() open a MS-Excel-like datasheet (under MS-Windows).

Loading a dataset

- setwd(): set working directory
- ▶ library(foreign): Enables R to load SPSS datasets
- read.spss(): Read SPSS dataset
- names(): show column ("variable") names of data object
- For a description see next slide

The teacher-expectancy data set

XXX

Inspect your data

head(dTeachExp) # prints first 6 cases

		ID	T	V weeks	weekcat
1	1	0.03	0.015625	2	2
2	2	0.12	0.021609	21	3
3	3	-0.14	0.027889	19	3
4	4	1.18	0.139129	0	0
5	5	0.26	0.136161	0	0
6	6	-0.06	0.010609	3	3

Another way to inspect your data is edit() or fix() (be careful not to modify your data unintentionally).

Accessing elements of a data frame

- Since R can handle many data objects, you first have to refer to a particular data object. Second, specify which element(s) you are interested in.
- There is a more general and a more specific method of accessing elements of a data frame: the [- and the \$-operator.

4 1.18

```
dTeachExp[,"T"] # access variable T
        [1] 0.03 0.12 -0.14 1.18 0.26 -0.06 -0.02 -0.32 0.27 0.80 0.54 0.18
    [13] -0.02 0.23 -0.18 -0.06 0.30 0.07 -0.07
dTeachExp$T # access variable T, shortcut for dTeachExp[,"T"]
        [1] 0.03 0.12 -0.14 1.18 0.26 -0.06 -0.02 -0.32 0.27 0.80 0.54 0.18
    [13] -0.02 0.23 -0.18 -0.06 0.30 0.07 -0.07
 dTeachExp[1:4,c("T", "weeks")] # access first 4 obs of T and weeks
             T weeks
    1 0.03
    2 0.12
           21
    3 -0.14 19
```

Saving a dataset

- save(object, file = "filename") saves a particular
 data (or a list of objects) object to the specified file.
- save.image(file = "filename") saves the current
 workspace (i.e., all objects shown by ls() or
 objects()).
- dump() or write.table() saves data objects in plain text files.
- ► The foreign package has functions to save data objects as SPSS, Stata, SAS files.

Section overview

Introduction
Preamble
Five basic R concepts

Installation, help and maintenance

Loading a (SPSS) dataset

Data cleaning and data preparation

Descriptive statistics

Mean, median & Co

Reproducible research (RR) and workflow Some basics ATEXin 5 minutes

Useful hooks and websites

Overview

- Generate new variables
- Select cases (subsetting/indexing) and variables
- Missing values

Creating new variables

```
dTeachExp$SE <- sqrt(dTeachExp$V)
head(round(dTeachExp, digits = 2))</pre>
```

	ID	T	V	weeks	weekcat	SE
1	1	0.03	0.02	2	2	0.12
2	2	0.12	0.02	21	3	0.15
3	3	-0.14	0.03	19	3	0.17
4	4	1.18	0.14	0	0	0.37
5	5	0.26	0.14	0	0	0.37
6	6	-0.06	0.01	3	3	0.10

Removing cases I (subsetting/indexing)

Relational (<, >, <=, >=, ==, !=) and logical operators (&, |, !) can be used to remove certain cases.

```
subset(dTeachExp, weekcat == 0)
```

	ID	T	V	weeks	weekcat	SE
4	4	1.18	0.139129	0	0	0.373
5	5	0.26	0.136161	0	0	0.369
9	9	0.27	0.026896	0	0	0.164
11	11	0.54	0.091204	0	0	0.302
12	12	0.18	0.049729	0	0	0.223

subset(dTeachExp, weekcat == 0 & T > 1)

	ID	T	V	weeks	weekcat	SE
4	4	1.18	0.139129	0	0	0.373

Removing cases II

subset() is one way to create subsets. Another possibility is using the [-operator.

dTeachExp[dTeachExp\$weekcat == 0,]

	ID	T	V	weeks	${\tt weekcat}$	SE
4	4	1.18	0.139129	0	0	0.373
5	5	0.26	0.136161	0	0	0.369
9	9	0.27	0.026896	0	0	0.164
11	11	0.54	0.091204	0	0	0.302
12	12	0.18	0.049729	0	0	0.223

dTeachExp[dTeachExp\$weekcat == 0 & dTeachExp\$T > 1,

	ID	T	V	weeks	${\tt weekcat}$	SE
4	4	1.18	0.139129	0	0	0.373

Removing (or keeping) cases III

Say, you want to remove cases based on a list of person IDs. In that case, you can use the %in% function.

```
keep.ids <- c(1, 4, 6, 8)
dTeachExp.new <- dTeachExp[dTeachExp$ID %in% keep.id</pre>
```

3 dTeachExp.new

	ID	T	V	weeks	${\tt weekcat}$	SE
1	1	0.03	0.015625	2	2	0.125
4	4	1.18	0.139129	0	0	0.373
6	6	-0.06	0.010609	3	3	0.103
8	8	-0.32	0.048400	24	3	0.220

Removing missing values

```
dTeachExp.missing <- dTeachExp
dTeachExp.missing$T[c(1, 3, 6)] <- NA
dTeachExp.missing$weekcat[c(2, 3)] <- NA
head(dTeachExp.missing)</pre>
```

	ID	T	Λ	weeks	weekcat	SE
1	1	NA	0.015625	2	2	0.125
2	2	0.12	0.021609	21	NA	0.147
3	3	NA	0.027889	19	NA	0.167
4	4	1.18	0.139129	0	0	0.373
5	5	0.26	0.136161	0	0	0.369
6	6	NA	0.010609	3	3	0.103

Removing missing values (cont'd)

dTeachExp.missing[!is.na(dTeachExp.missing\$T),][1:6,]

```
ID
              V weeks weekcat
                              SE
2 2 0.12 0.021609
                   21
                         NA 0.147
4 4 1.18 0.139129 0
                         0 0.373
5 5 0.26 0.136161 0 0 0.369
7 7 -0.02 0.010609 17 3 0.103
                      3 0.220
8 8 -0.32 0.048400
                   24
9 9 0.27 0.026896
                 0
                        0.0.164
```

na.omit(dTeachExp.missing)[1:6,]

	ID	T	V	weeks	${\tt weekcat}$	SE
4	4	1.18	0.139129	0	0	0.373
5	5	0.26	0.136161	0	0	0.369
7	7	-0.02	0.010609	17	3	0.103
8	8	-0.32	0.048400	24	3	0.220
9	9	0.27	0.026896	0	0	0.164
10	10	0.80	0.063001	1	1	0.251

Removing variables

```
d (dTeachExp.names <- names(dTeachExp))</pre>
 [1] "TD"
             "T"
                      пVп
                                 "weeks" "weekcat" "SE"
Remove the 1 and 3 variable
dTeachExp[1:2, c(dTeachExp.names)[-c(1,3)]]
     T weeks weekcat. SE
 1 0.03 2
                   2 0.125
 2 0.12 21 3 0.147
Remove weeks and weekcat.
! (dTeachExp.names %in% c("weeks", "weekcat"))
 [1]
     TRUE TRUE TRUE FALSE FALSE TRUE
dTeachExp[1:2,!(dTeachExp.names %in% c("weeks", "weekcat"))]
   TD
                   SF.
 1 1 0.03 0.015625 0.125
 2 2 0.12 0.021609 0.147
```

What is reproducible research?

"By reproducible research, we mean research papers with accompanying software tools that allow the reader to directly reproduce the results and employ the methods that are presented in the research paper" (Gentleman/Lang 2004: 1).

Requirements for the workflow: TREMMP

- ► Transparency (e.g., by using dynamic documents, "The source code is real")
- Reproducibility (e.g., by using dynamic documents, "The source code is real")
- Efficiency (a good workflow saves you time, by automating as much of the process as possible)
- Maintainability (standardized script names, good commenting practices, README files)
- Modularity (discrete tasks into separate components (e.g. scripts))
- Portability (e.g., by using relative (not absolute) pathnames)

(Source: David Smith on "A workflow for R": http://blog.revolutionanalytics.com/2010/10/a-workflow-for-r.html)

The source code is real

"The source code is real. The objects are realizations of the source code. Source for EVERY user modified object is placed in a particular directory or directories, for later editing and retrieval" (Rossini et al. 2011:ESS - Emacs Speaks Statistics - Manual)

Use source() to read R code from a file

The R console can be used for short and temporary tests. In order to establish a TREMMP workflow, however, it is required to write R programs and to source them. So, use source(file = "myfile.R") to run an external R program. In SPSS, you would create an .sps-file, in Stata a .do-file.

What is LATEX

- ► LATEX is a markup language. Another markup language you might know is HTML.
- ► LATEX provides high-quality typesetting features.
- ► The typical workflow is as follows:
 - 1. Create LATEX source code file (.tex)
 - 2. Compile it via LATEX or pdfLATEX
 - 3. Use a viewer (PDF, DVI or via dvips PS) to view the compiled file
- In order to run LaTeX on your computer, you will need to install a LaTeX-distribution (e.g., MikTeX for MS-Windows).

The TEX work flow

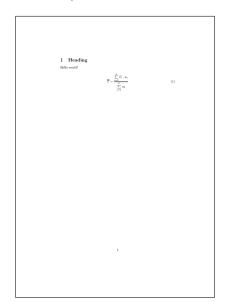

Source: http://media.texample.net/tikz/examples/PDF/texworkflow.pdf

What a LATEX file looks like

```
%% Part 1: Preamble
  \documentclass{article}
  \usepackage[utf8]{inputenc}
  \usepackage[T1]{fontenc}
  \usepackage[english]{babel}
6
  %% Part 2: Body
  \begin{document}
9
  \section{Heading}
  Hello world!
14
  \begin{equation}
15
  \operatorname{T} = \frac{\sum_{k}^{k}_{i = 1} %}
16
    T_{i}\cdot dot w_{i}}{\sum_{i=1}^{k}_{i}}
  \end{equation}
18
19
  \end{document}
20
```
